You are given the task of extending the Solder:bit boards with more NeoPixel LEDs. A design review has highlighted that we need more blinking lights than the 5x5 LED matrix on the Micro:bit can supply!

1. Download the existing design files by cloning or downloading the repository
<https://github.com/devices-lab/pro2-kicad-workshop>
(Direct Zip download: <https://tinyurl.com/kicad-files>)
2. Add 5 Neopixels and their support components to the design in the Schematic Editor
3. Select which footprints you need for the new parts with the Part Selection tool
4. Move to the PCB Layout Editor and import the changes
5. Lay out your new components (extra points for being artistic with your placement! 😊)
6. Build a Bill Of Materials (BOM) and Gerber file set for the next workshop
